| <b>Project Name</b>  | RISING WATERS |
| <b>Maximum Marks</b> | 2 Marks       |

### Customer Journey Map:

The Customer Journey for RISING WATERS traces the step-by-step experience of key users—including flood-prone residents, meteorologists, and disaster coordinators—as they navigate from seasonal climate anxiety to real-time proactive safety. It details how users interact with the multi-page Flask interface to submit localized weather observations, obtain instant high-accuracy risk metrics, and confidently coordinate preventive emergency actions or life-saving evacuations.

| Phase of Journey                                                            | Stage 1<br>Assessment & Data Input                                                                                                                           | Stage 2<br>Risk Processing & Prediction                                                                                   | Stage 3<br>Decision & Emergency Response                                                                                        |
|-----------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| <b>Actions</b><br><i>What does the customer do?</i>                         | 1.Logs into the dashboard .<br>2.Gathers current meteorological values (annual rain, cloud visibility) .<br>3.Fills out and submits the web parameters form. | 1.Waits for model computation .<br>2.Views the instant flood probability result .<br>3.Reviews historical regional trends | 1. Evaluates the flood risk severity .<br>2. Coordinates resource allocation .<br>3. Issues early public evacuation advisories. |
| <b>Touchpoint</b><br><i>What part of the service do they interact with?</i> | 1. Flask Web App Portal Login screen .<br>2.Intuitive Data Input Web Form.                                                                                   | 1.Dynamic Results Dashboard UI .<br>2. Past Predictions History Panel.                                                    | 1. Public Early Warning Interface .<br>2. Disaster Response System.                                                             |
| <b>Customer Thought</b><br><i>What is the customer thinking?</i>            | 1. "Are these weather readings completely accurate?"<br>2. "Is this submission form fast enough to save time?"                                               | 1. "Can I trust this XGBoost model's calculation?"<br>2. "Does a high probability mean immediate action?"                 | 1. "How many hours do we have left to evacuate safely?"<br>2. "Are rescue assets prioritized correctly?"                        |

|                                                                   |                                                                                                             |                                                                                                                                         |                                                                                                                                  |
|-------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
|                                                                   |                                                                                                             |                                                                                                                                         |                                                                                                                                  |
| <b>Customer Feeling</b><br><i>What is the customer feeling?</i>   | Anxious, cautious, and urgent due to incoming monsoons.                                                     | Anticipant but reassured by the model's high speed.                                                                                     | Confident, secure, and empowered to protect lives.                                                                               |
| <b>Process Ownership</b><br><i>Who is in the lead on this?</i>    | System Admin / Meteorologist                                                                                | Flask Server Backend & ML Engine                                                                                                        | Disaster Relief Coordinator                                                                                                      |
| <b>Opportunities</b><br><br><i>How can we improve this stage?</i> | 1. Integrate automated third-party weather API feeds.<br>2. Add tooltips to assist users during data entry. | 1. Implement continuous pipeline learning for evolving weather patterns.<br>2. Cache frequent queries to speed up background execution. | 1. Set up automated SMS warning alerts directly from the UI.<br>2. Build a real-time geographical mapping visualization overlay. |
